

IOT PROJECT

Smart Connected Signs for Improved Road Safety

By:

Karthik P AjithKumar(19BEE1216)

Aaron Richard Thomas(19BEE1132)

Mishel Thomas Mohan(19BEE1145)

Noel Saji(19BEE1173)

I. INTRODUCTION

- **OVERVIEW**

In this project we have built '*Smart Connected signs for Improved Road Safety*' using the IBM IOT platforms. Depending upon the weather condition received from the OpenWeatherApp we have displayed the speed to be maintained while driving, the traffic Density etc. through different areas like Schools and Hospitals. We also have got the data in a mobile application using MITInventorApp.

- **PURPOSE**

The road safety in our country has remained idle and constant for a brief span of time. In present Systems the road signs and the speed limits are Static. But the road signs can be changed in some cases. We can consider some cases when there are some road diversions due to heavy traffic or due to accidents then we can change the road signs accordingly if they are digitalized. This project proposes a system which has digital sign boards on which the signs can be changed dynamically. If there is rainfall then the roads will be slippery and the speed limit would be decreased. There is a web app through which you can enter the data of the road diversions, accident prone areas and the information sign boards can be entered through web app. This data is retrieved and displayed on the sign boards accordingly.

II. LITERATURE SURVEY

- **EXISTING PROBLEM**

In our country there are numerous problems regarding the road safety for the driver and also the people surrounding him. Some of these existing problems are:

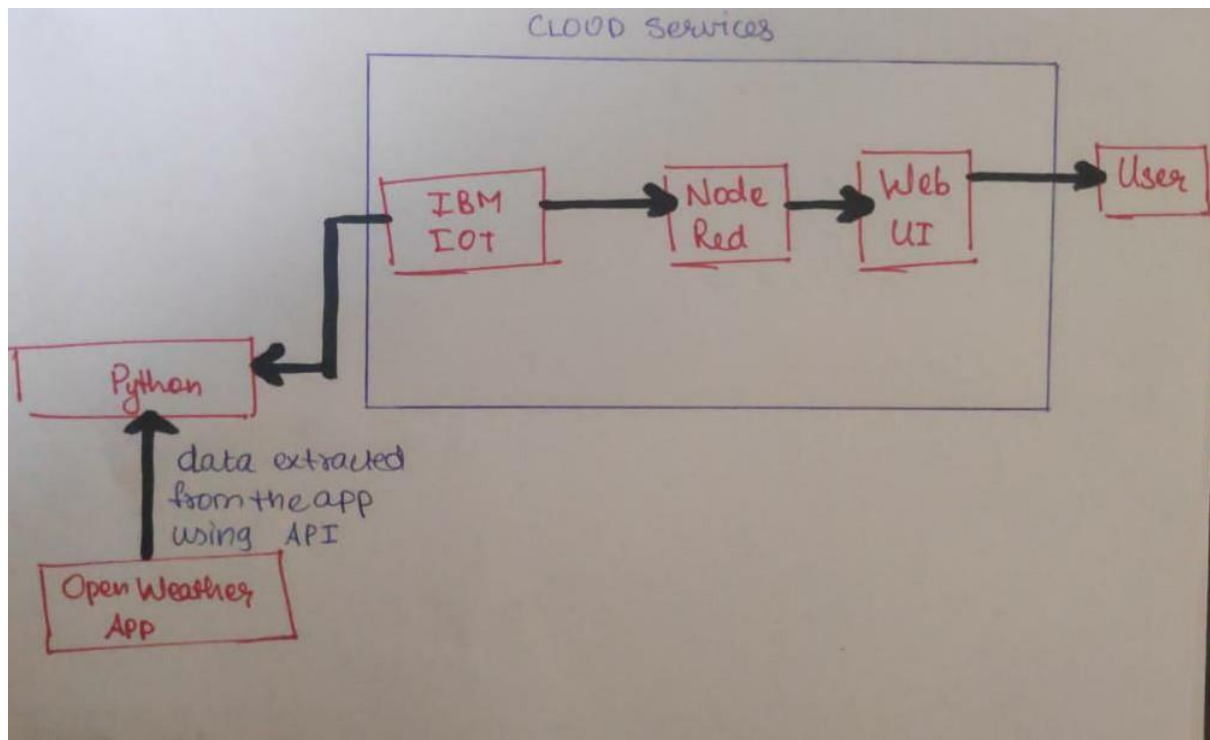

1. Alcohol Impaired Driving
2. Autonomous Vehicle
3. Drowsy Driving
4. Drug Impaired Driving
5. Speeding and Aggressive Driving

- **PROPOSED SOLUTION**

This project proposes a system which has digital sign boards on which the signs can be changed dynamically. If there is rainfall then the roads will be slippery and the speed limit would be decreased. There is a web app through which you can enter the data of the road diversions, accident prone areas and the information sign boards can be entered through web app. This data is retrieved and displayed on the sign boards accordingly.

III. THEORITICAL ANALYSIS

- **BLOCK DIAGRAM**

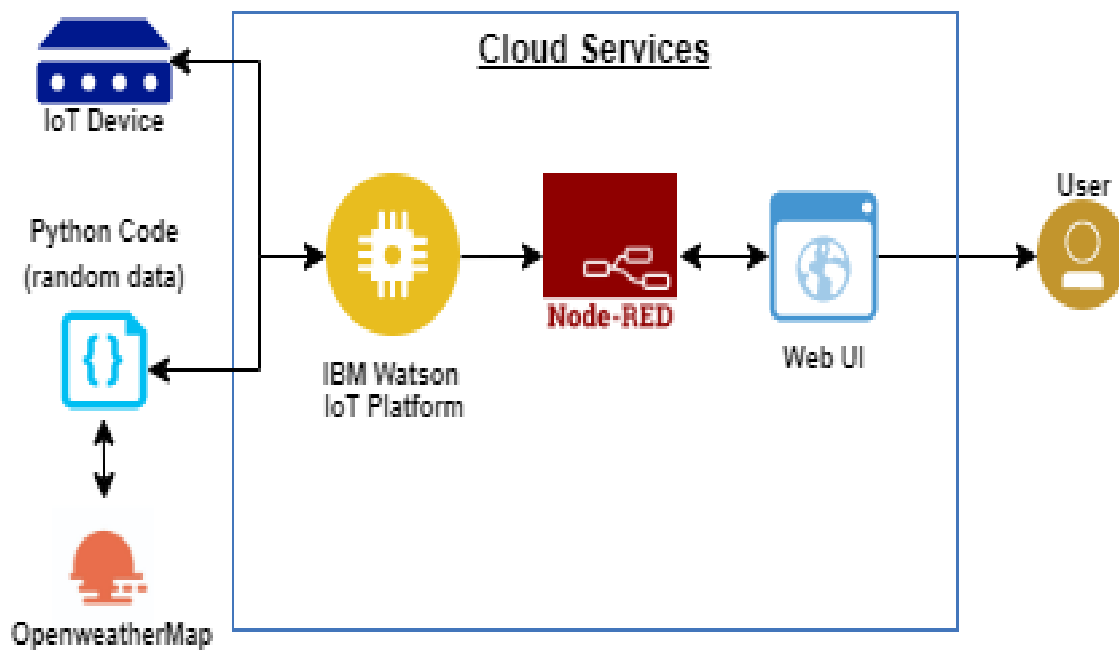

- **HARDWARE AND SOFTWARE DESIGNING**

In this project that we have completed, my team have not used any hardware device for obtaining data. Every aspect of the project was designed from the software point of view including obtaining Weather Data. Usually, the weather data is obtained using hardware devices since it was not possible for us, we used *OpenWeatherApp* to obtain the weather data using the API keys. As far the other processes are concerned, we used

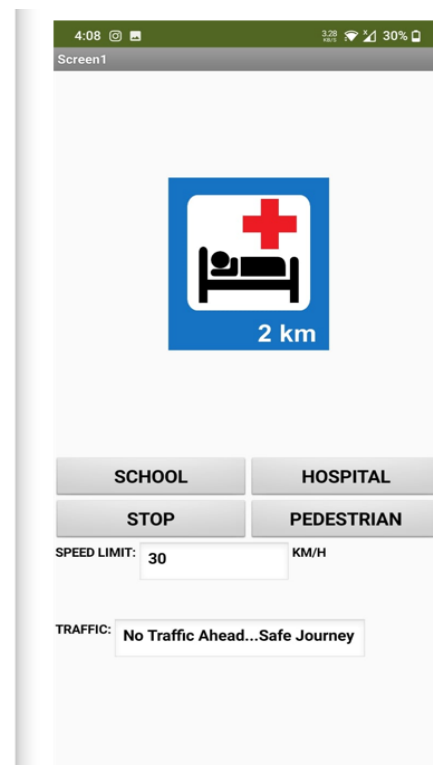

Python to extract the weather data and we used the *IBM Cloud* platform to store the data and the signs for the zones (School, Hospital, etc.). Then we created an app using *MIT Inventor App* for displaying the details.

IV. FLOWCHARTS

V. RESULTS

After gathering the weather data we were able to get the results in the mobile application.

VI. ADVANTAGES AND DISADVANTAGES

- **ADVANTAGES**

When it comes to the advantages, Smart improved road signs are highly beneficial for us in our day to day life because the current road safety system in our country does not account for weather conditions which is one of a major factor for road safety, but in our work we have considered that factor and also the traffic density which gives us a clear information on speed to maintained while driving through different zones(Schools, Hospital etc.).

- **DISADVANTAGES**

One of the disadvantages is that we do not have the accurate value for the weather description.

VII. APPLICATIONS AND FUTURE SCOPE

- In our near future we can improve the road safety with the following benefits:

Less-congested streets. For an average US citizen, congestion costs 99 hours of their time and USD 1,377 each year.² Smart road technology can track vehicles and adjust traffic lights when there are fewer or no cars approaching, helping prevent bumper-to-bumper traffic. This could help drivers and passengers save 9.4 hours each year.¹

Improved traffic and pedestrian safety. Traffic-monitoring solutions powered by computer vision can detect vehicles, pedestrians, and bicyclists to help enable safety practices. In the event of a crash or crime on the street, smart devices can immediately alert first responders.

Enhanced parking and e-tolling. E-tolling reduces congestion by using license plate recognition and vehicle tracking to automatically charge highway and bridge tolling fees—all without making vehicles stop or slow down.

By sending select data to the cloud to be analyzed over time, cities can make continual improvements in traffic management, road maintenance, and environmental quality, for example:

Identifying problem areas. Analytics can help detect intersections or other sites that have a high rate of collisions or near misses between vehicles or pedestrians. This helps cities determine if the site would benefit from a yield or stop sign, crosswalk, or traffic light.

Improving pavement conditions. Over time, streets erode or weather away. With road condition monitoring, cities can assess pavement conditions and act accordingly.

Reducing pollution. Smart infrastructure can help reduce carbon emissions from daily transportation by optimizing traffic flow to avoid idling engines. Cities can also help reduce pollution by understanding where to best place electric vehicle charging stations

- **SCREENSHOTS**

Python code

The screenshot displays a Windows desktop environment. In the foreground, a code editor window titled 'wthr.py - C:\Users\KKH\Desktop\IBM\wthr.py (3.9.6)' is open. The code is a Python script that interacts with the OpenWeatherMap API to fetch weather data for a user-specified city. The script includes comments for each step, from importing modules to parsing the JSON response. The API key used is '560c4b69bb0a2c87ee3b704e9efed8e8'. The script constructs a URL, sends a GET request, and prints the resulting JSON data.

```

IBM CLOUDANT OUTPUT:

The screenshot shows the IBM Cloudant web interface. On the left is a sidebar with navigation options: All Documents, Query, Permissions, Changes, and Design Documents. The main area displays document details for two documents. The first document has ID "09e815bf47b5d616e1526dfc38f66029" and contains a JSON object with fields for id, key, value, rev, and doc. The second document has ID "37072645a373f98da0e2c3f041390d60" and contains a similar JSON object. The interface includes a top navigation bar with a search bar, document ID, options, and a 'Create Document' button. The bottom status bar shows 'Showing document 1 - 20' and 'Documents per page: 20'.
